The world of Codes

5-Examples

The basic structure of the internal codes of each board is as follows:

$$\dfrac{\overline{\dfrac{\overline{\dfrac{\overline{XX}}{YY}}}{ZZZ}}}{ABCDE} \quad \dfrac{KK}{HH}$$

Some internal code readers return the result in a slightly different form, with the initial letter of the code name followed by ":" and the relative numeric value. We therefore have a similar structure:

$$XX \quad e{:}YY \quad s{:}ZZZ \quad p{:}ABCDE \quad v{:}\dfrac{KK}{HH}$$

We remember the meaning of each number contained in the basic structure of the internal codes.

- XX represents the "CLASS" code;
- YY represents the "EMISSION" code;
- ZZZ represents the "SERIES" or "IDENTIFIER" code; ABCDE represents the
- "PROGRESSIVE" code;
- KK represents the code "BIT VALUE WEIGHT"; HH
- represents the code "VALUE".

Let's now see some examples to better explain what has been described so far. Take for example the code 01/05/064/21365 04/50. The correct name is associated with each code in the following table.

Code Example	Meaning
01	Class
05	Issue
064	Series
21365	Progressive
04	Bit weight value
50	Value

As previously mentioned, the combination of the "class" and "issue" codes (01/05 in the example) represents the issuing period of the card. The "series" code (064 in the example) indicates the magnetization lot of the board. This means that, if the card has a circulation of less than 65,000 copies, only one value of the "series" code is sufficient to contain the entire circulation, increasing each time only the progressive value (21365 in the example). The card, with the same image as the previous one, which follows the card in the example will therefore have the code 01/05/064/21366 04/50.

The last considerations regarding the consequentiality of cards with the same image are generally valid, but there are some exceptions that will be described in the paragraph Mistake. The reference origin was not found. Furthermore, for cards with high / very high runs it is possible to find very different codes, due to their issue even after months.

Finally, let's see the codes relating to the residual value (04/50 in the example). The card is new: it contains 50 shots, equal to 10,000 lire of phone calls. Not having exhausted the available clicks, the "value bit weight" code is equal to 04. The same card, once exhausted, will have the code 01/05/064/21365 - / 00.
